

Operational Maturity Diagnostic Framework

Email: joanna.wen@oaklin.com · Generated: 30 March 2026 · Version 1

Description

Organisations lack honest visibility into their operational maturity against industry benchmarks and struggle to identify specific pain points. Team members and managers hesitate to be fully candid in surveys, obscuring true performance gaps.

This disconnect creates tangible business consequences: reduced efficiency and productivity, as managers lack visibility into what team members are doing on a day-to-day basis, preventing them from targeting actions to improve ways of working. These visibility gaps manifest in measurable operational impacts including increased costs, low productivity, low quality outputs, missed SLAs, project delays, and deteriorating business KPIs. A diagnostic tool capturing dual perspectives (manager and member lens) across back, middle, and front office functions would surface authentic insights and enable organisations to address these hidden performance gaps. The tool will allow organisations to upload existing survey responses and other datasets alongside the diagnostic assessment, providing additional context and enabling deeper analysis of candour patterns and their measurable impact on operational performance, whilst helping quantify the business consequences of visibility gaps across key metrics.

Stakeholders / Responsibility

Primary users: organisational leaders and team managers seeking honest operational assessment.

Key stakeholders: team members providing candid input; diagnostic tool designers; implementation owners responsible for translating insights into action.

Implementation owners include team managers, department leads, and function heads who hold decision-making authority over operational improvements.

The diagnostic tool generates a prioritised list of actions tailored to their authority level: strategic recommendations suitable for escalation to the c-suite, and immediate quick wins that can be implemented without further approval. This dual-track approach enables implementation owners to drive change at both strategic and tactical levels, maximising the impact of diagnostic insights across the organisation.

Context and Scope

Applies across industries and organisational functions (back, middle, front office).

Scope: assessment and insight generation in response to key business drivers including breakdown of siloed ways of working, transition to new operating models, system or technology implementation, change programme support, quality metric improvement, and SLA enhancement.

Out of scope: change management execution or ongoing performance tracking post-implementation.

Current Situation and Desired Outcome

Current: organisations rely on surveys that lack candour, limiting understanding of true pain points and maturity gaps.

Desired: leaders receive honest, detailed diagnostic insights and a prioritised set of short-term wins and long-term goals linked to measurable maturity outcomes, enabling confident action planning.

Evidence and Assumptions

No quantified evidence provided yet.

Key assumptions: dual-lens feedback (manager and member) will increase honesty; actions linked to maturity assessment outcomes will be more implementable; improvement in assessed areas signals action effectiveness. Evidence will be drawn from multiple sources including the operational maturity assessment, productivity metrics within teams, sentiment analysis from surveys, and additional performance indicators to understand how teams are being impacted. Testing the dual-lens approach will involve comparing honesty levels and response quality between dual-source and single-source feedback mechanisms, using the aforementioned data sets to validate whether the dual-lens method produces measurably different outcomes in team engagement and candour.
